

Part of the requirements not completed/implemented in the project :

- **Search history**

Users search history could be viewed on his personal dashboard. This could help the user to find the recipes that he saw in the past. But this was somewhat done by showing the liked and saved recipe by the user in his personal dashboard.

- **Following & followers**

At the initial stages of development it was decided that a user can follow any other user and then can find all the recipes that were uploaded by that user. But later a filter is added in the search recipe only wherein a user can directly find other users recipes by typing their names.

- **Personalized feed**

Personalized feed was kept so that a user can get recipes according to the previous searches made by the user on his home screen. But as a user can search without logging/registering himself it will not provide proper feed to the user every time.

- **Suggestion and feedback**

Currently suggestion and feedback are not integrated because no regulation on one language in the comments section and that could become offensive to some people,group or community.

- **Access cook's profile**

A user can access user's profile and can find recipes uploaded by them, their followers and whom they were following. But the idea was dropped as follows & followers were not implemented.

- **Share**

Users can share a recipe to other users and on clicking that link another user can see that recipe. But this can now also be achieved by adding recipename and chef names in the search page and get that recipe in just 2 clicks..

- **Mobile browsers**

Currently the system is not very compatible on mobile devices.
